# 1 Introduction

Tatham Engineering Limited has prepared this Stormwater Management (SWM) Report in support of a site plan approval application of a residential development located in the Town of Collingwood, County of Simcoe. Specifically, this report has been prepared to address the internal and external servicing requirements related to stormwater management associated with the project.

## 1.1 OBJECTIVES

The primary objective of this report is to investigate the existing and proposed drainage conditions of the subject property to develop a stormwater management plan that not adversely affect local surface water quantity or water quality conditions. This will be accomplished by evaluating the effect of the development on local drainage conditions and, where necessary, providing solutions to mitigate any adverse impacts.

## 1.2 GUIDELINES & BACKGROUND REPORTS

This report was prepared recognizing provincial guidelines on water resources and the environment, including the following publications:

- The Ministry of the Environment, Conservation and Parks (MECP) Stormwater Management Practices Planning and Design Manual (2003);
- Town of Collingwood Development Standards (2007); and
- Nottawasaga Valley Conservation Authority Stormwater Technical Guide (2013).

Additional reports have been prepared in conjunction with this report in support of the proposed residential development and are summarized below.

- *Cranberry Marsh Estates Preliminary Stormwater Management Report* prepared by C.C. Tatham & Associates Ltd. (October 2011);
- Regional Stormwater Management Update & Master SWM Strategy - Tanglewood at Cranberry Trail / Cranberry Creek Watershed - Tanglewood (Sierra Homes) Inc., prepared by Crozier (May 2007);
- *Flood Study - Wyldewood Creek* prepared by C.F. Croziers & Associates Inc. (September 2020); and
- *Regional Stormwater Management Update & Master SWM Strategy* prepared by C.F. Crozier & Associates Inc. (May 2007).

## 2 Development Site

### 2.1 SITE LOCATION & DESCRIPTION

The subject property consists of approximately 1.29 ha of undeveloped land located south of Highway 26 in the Town of Collingwood. The site is currently vacant, and primarily tree covered with an environmentally protected marsh area at the south end of the property.

The municipal address of the subject property is 11589 Highway 26. The subject property is bounded by Highway 26 to the north, Georgian Manor Resort to the west, Greentrees Nursery & Emporium to the east, and the Cranberry Marsh to the south. The subject property is zoned as R3-34 (H10) – *Residential Third Density Exception 34*, excluding the southern portion of the site, which is zoned as EP-11 – *Environmental Protection Exception 11*. The subject property is regulated by the Nottawasaga Valley Conservation Authority (NVCA).

### 2.2 SURFACE CONDITIONS

A topographic survey of the subject property was completed by C.C. Tatham & Associates Ltd. in 2012 and updated based on a recent survey completed by Tatham Engineering in October 2022. The existing grading of the 170 m deep segment of land fronting Highway 26 generally slopes from the south to the north at an average gradient of 0.6%. The remainder of the subject property generally slopes from the north to south at an average slope of 0.3%. The site is currently vacant, and primarily tree covered with an environmentally protected marsh area at the south end of the property.

Refer to the Pre-Development Drainage Plan (DP-1) for details on existing drainage areas.

### 2.3 SUBSURFACE CONDITIONS

A geotechnical investigation, submitted under separate cover, completed by Peto MacCallum Ltd. dated January 2022. Fieldwork was conducted on November 22, 2021, consisting of four boreholes. The boreholes advanced to auger refusal, 3.4 m to 3.7 m below existing ground surface. Subsurface conditions are as follows:

- 50 mm to 200 mm of surficial topsoil;
- Borehole 1 showed a 650 mm layer of silt that was found to be very moist;
- Boreholes 2 - 4 showed a 0.5 m to 1.3 m layer of loose sand with trace amounts of silt and organics. The sand was found to be wet;
- A major till deposit extends below the silt or sand layers to the termination of the boreholes at 3.4 m for Borehole 3, and 3.7 m for Boreholes 1, 2 and 4. The till matrix varied from a silt

and sand with trace gravel and trace clay to a sandy silt with some gravel and trace clay. The till density was loose to very compact; and

- Auger refusal could have been due to boulders in the till or a shallow bedrock common in the area.

Groundwater was measured in the monitoring wells (Boreholes 1, 3 and 4) one month after installation (December 17, 2021). The geotechnical investigation established that the stabilized groundwater table is within 0.5 m of the ground surface at 179.30 m.

The soil has been classified as Parkhill loam or silt loam (Type BC), as per the *Soil Survey of Simcoe County - Report No. 29 of the Ontario Soil Survey*, completed by the Ontario Department of Agriculture. This soil group has low to moderate infiltration rates when thoroughly wetted.

## **2.4 PROPOSED DEVELOPMENT**

The proposed development features a 7.2 m private road and cul-de-sac, beginning at Highway 26 and extending 220 m towards Cranberry Marsh, followed by a turning circle. The development will feature 5 buildings fronting the road and cul-de-sac, which will comprise of 26 townhomes. The majority of the lots will have 6 m frontages and are 28 m deep. The proposed development is shown on the Site Grading Plan (SG-1).

## 3 Existing Drainage Conditions

Information regarding the existing topography, ground cover and drainage patterns were obtained through collection of detailed topographic survey data, aerial photos and the review of relevant background reports.

### 3.1 SURFACE DRAINAGE & RUNOFF

#### 3.1.1 Development Site

The existing grade of the northern portion of the subject site (Catchment 101) generally slopes from the south to the north at an average gradient of 0.6%, discharging to an existing ditch conveying water towards the west property line where it enters an existing 600 mm diameter CSP. The CSP outlets into the roadside ditch south of Highway 26. The southern portion of the subject site (Catchment 102) generally slopes from the north to south at an average slope of 0.3%, outletting into the Cranberry Marsh to the south. Refer to the Pre-Development Drainage Plan (DP-1) for details on existing drainage areas.

#### 3.1.2 Cranberry Marsh

The Cranberry Marsh borders the subject property to the south and various other properties described in this report. The Cranberry Marsh has been identified as a Provincially Significant Wetland (PSW). As part of the Tanglewood at Cranberry Trail Development, a regulatory floodplain elevation of 179.65 masl was approved for the Cranberry Marsh. This was based on an additional analysis prepared by C.F. Crozier & Associates Inc. in support for the Tanglewood at Cranberry Trail Development (May 2007).

#### 3.1.3 Greentrees Nursery & Emporium

Surface runoff from the Greentrees Nursery & Emporium property drains overland as sheet flow into perimeter ditches surrounding the property.

The west perimeter ditch (adjacent to the east property line of the subject site) has an average slope of 0.1% to the north and has various high and low points. Runoff from the ditch enters an existing 300 mm diameter CSP culvert that conveys runoff to an existing storm maintenance hole on the south side of Highway 26. This storm maintenance hole is connected to a maintenance hole on the north side of Highway 26 via a 300 mm diameter CSP pipe, discharging into the north Highway 26 roadside ditch opposite the subject property.

The Greentrees Nursery & Emporium south perimeter ditch connects directly to the west perimeter ditch and Cranberry Marsh. Depending on the water level in the Cranberry Marsh, this ditch also surcharges and functions as a storage area.

Under surcharged pipe conditions or elevated Cranberry Marsh water levels, the ditch water levels can rise to a level that causes water to spill over the west bank of the west ditch into the subject property. Runoff then flows northwest overland across the subject property where it eventually discharges into the Highway 26 roadside ditch.

There are plans by Sherwood Homes to re-develop Greentrees Nursery & Emporium. Tatham Engineering has been retained to develop the site grading plan and the stormwater management plan for this new development, presenting a unique opportunity to develop Cranberry Marsh Estates stormwater management plan in conjunction with the future Greentree Development. Modifications to the Greentree site drainage will include replacement of the west ditch that functions with both the Greentree site and the proposed Cranberry Marsh Estates site (existing elevations along the adjoining property line are subject to change).

#### **3.1.4 Georgian Manor Resort**

The quadplex residential development immediately adjacent to the west property boundary of the subject site drains east to a 4.0 m utility easement located between the two properties. A high point approximately 175 m from the north property boundary directs flows north to the Highway 26 roadside ditch (from catchment 301) or south to an existing Stormwater Management Facility (SWMF) servicing Georgian Manor Resort (from catchment 302). There is no defined swale or ditch within the bordering properties, as such runoff from the rear of the quadplex units will spill into the Cranberry Marsh Estates property before ultimately draining to Highway 26 roadside ditch or the existing SWMF.

#### **3.1.5 South Highway 26 Roadside Ditch Draining West**

The south roadside ditch of Highway 26 draining west has a flat slope of less than 0.5%. As per *Cranberry Marsh Estates Preliminary Stormwater Management Report* prepared by C.C. Tatham & Associates Ltd. (October 2011), the ditch does not provide a sufficient outlet for the flow directed to it under flood spill conditions and as a result can cause additional flooding of adjacent lands between Princeton Shores Boulevard and the Cranberry Marsh Estates property.

### **3.2 SURFACE DRAINAGE & RUNOFF**

The existing conditions, considering the site's surface and subsurface conditions, have been modelled in Visual OTTHYMO to establish the pre-development peak flows. The pre-development flows results are summarized in Table 1 and supporting calculations are provided in Appendix A.

# 4 Proposed Stormwater Management Plan

## 4.1 DESIGN CRITERIA

The proposed stormwater management plan is subject to the review and approval of the Town of Collingwood and the NVCA. Issues to be addressed and criteria to be met regarding the development of the site are summarized below.

### 4.1.1 Stormwater Quality Control

Water quality controls must be provided to satisfy the MECP SWM Practices Planning and Design Manual. Georgian Bay is the ultimate receiving waterbody for site drainage to the Highway 26 roadside ditch north of the subject and external sites (Catchment 201/303). The Cranberry Marsh is the receiving waterbody for drainage from subject and external sites to the south (from Catchment 202/203/204/205/206/304). Enhanced level water quality protection is required in the form of 80% total suspended solids (TSS) removal and treatment of 90% of the surface runoff generated from the contributing drainage area that occurs on a long-term average basis.

### 4.1.2 Stormwater Quantity Control

Proposed condition peak flow rates discharging into the Highway 26 roadside ditch north of the subject site (from Catchment 201) must be controlled to existing condition rates for all storms up to and including the 100-year event to ensure there are no adverse impacts for downstream landowners.

*A Regional Stormwater Management Update & Master SWM Strategy* prepared by C.F. Crozier & Associates (May 2007) confirmed that increases in the Cranberry Marsh water levels resulting from increased runoff volumes from new developments within the Cranberry watershed north of the Georgian Trail are to be mitigated by hydraulic improvements to Cranberry Creek and the Cranberry Marsh Outlet. As the Cranberry Marsh is the ultimate receiving waterbody for the subject site drainage to the south (Catchment 202/203/204/205/206), pre- to post- quantity control is not required. Safe conveyance to a sufficient outlet must be provided for the Regulatory Storm event.

### 4.1.3 Siltation and Erosion Control

Recommendations for a siltation and erosion control strategy that will be implemented during construction must be provided.

## 4.2 PROPOSED DRAINAGE CONDITIONS

The proposed Cranberry Marsh Estates Development will include 215m of 7.2m private road terminating north of the Cranberry Marsh with a cul-de-sac. The development will feature 26 townhome units fronting the proposed street.

The east portion of the site (Catchment 203/204/205/206) will be conveyed via a series of side-yard swales towards the road. Via a series of double catch basins at designated low points along the road, accumulated runoff in the road will drain under the proposed sidewalk and into a proposed enhanced grass ditch/bio-swale near the east property line of the subject site. The enhanced grass ditch accommodates up to and including the 25 mm design storm before spilling over into the protected area bordering the Cranberry Marsh at the south end of the site, ultimately flowing into the Cranberry Marsh. The runoff from half of the rear yards of proposed Block 4 and 5 (Catchment 202), as well as the runoff from the rear yards of the southern three and a half buildings at the Georgian Manor Resort (Catchment 304) will be collected by a swale and conveyed towards the Cranberry Marsh. Catchments 202, 203, 204, 205, 206 and 304 do not require quantity control as per the *Regional Stormwater Management Update & Master SWM Strategy* prepared by C.F. Crozier & Associates (May 2007).

The runoff from the rear yards of proposed Block 1, 2, 3 and half of block 4 (Catchment 201) and the rear yards of the northern four and a half buildings at the Georgian Manor Resort (Catchments 303) will be collected by a swale that will convey the water towards the Highway 26 roadside ditch.

The proposed drainage patterns are shown on the *Post-Development Drainage Plan (DP-2)*.

## 4.3 WATER QUANTITY

A Visual OTTHYMO model was developed to determine peak flow rates from the subject site under existing and proposed conditions for the 25mm through 100-year storm events. The model was then used to compare the peak flow rates to existing condition levels to the proposed stormwater management design. A summary of proposed condition peak flow rates is provided in Table 2. The proposed condition supporting calculations are provided in Appendix B.

**Table 2: Post-Development Peak Flow Rate Summary**

| POST-DEVELOPMENT PEAK FLOW RATE (M <sup>3</sup> /SEC) |                                     |                                  |   |                                      |

*Note: Values in brackets represent existing condition flows*

The results shown in Table 2 confirm that the proposed condition peak flow rates from catchments 201/303 discharging to the Highway 26 ditch are maintained below existing condition levels for storms up to and including the 100-year storm event. Post peak flows to the south (Catchment 202-206/304) will discharge to the Cranberry Marsh uncontrolled as pre- to post- quantity controls is not required.

Emergency overland flows will spill over the east curb and gutter and be conveyed as sheet flow towards the enhanced grass ditch. The overland flow routes will pond to a maximum depth of 150 mm in the roadway.

The enhanced grass ditch overflow outlet will allow for a peak weir flow of 0.293 m<sup>3</sup>/s at 160 mm of depth, which can accommodate the modelled 100-year storm peak flow of 0.257 m<sup>3</sup>/s for catchment 203, 204, 205 and 206 that drains towards the ditch. The bed of the ditch will consist of a permeable soil layer, filter fabric and a gravel layer with a perforated pipe to allow the storage component of the ditch. Refer to the Post-Development Drainage Plan (DP-2) and the (SG-1) Site Grading Plan for the proposed drainage patterns. Weir flow calculations are detailed in Appendix C.

#### 4.4 WATER QUALITY

Enhanced water quality controls must be provided to satisfy the MECP SWM Practices Planning and Design Manual, requiring in the form of 80% total suspended solids (TSS) removal and treatment of 90% of the surface runoff generated from the contributing drainage area. The details pertaining to the water quality control measures to be implemented are summarized as follows:

- **Catchment 203/204/205/206** – Runoff from these catchments derives from the road, cul-de-sac and the driveway of all the proposed units, along with half the rooftops and front yards. Enhanced water quality controls for this catchment will be provided by a flat-bottom enhanced grass ditch/bio-swale before discharging into the Cranberry Marsh. The ditch conforms to runoff quality treatment in grass swales criteria provided in Section 4.5.9 of the MOE Stormwater Management Planning and Design Manual (March 2003) and has the design capacity to retain the 25 mm design storm or the first flush of major storm events. Water volumes exceeding the ditch capacity will discharge through a rip rap spillway at the south extent of the bio-swale and into the protected area bordering Cranberry Marsh, ultimately discharging into the Cranberry Marsh. Runoff will enter the ditch through a series of four double catch basins inlets along the road. The bed of the ditch will consist of a permeable soil layer, filter fabric and a gravel layer with a perforated pipe to provide enhanced water quality treatment and allow the storage component of the ditch to drain.
- **Catchments 201/303** – Runoff from these catchments derive from rooftops and lawns before discharging into the Highway 26 roadside ditch and are considered clean runoff. Therefore, no water quality controls are required.
- **Catchment 202** – The runoff from this catchment derives from rooftops, lawns, a play area, a small section of asphalt trail and the environmentally protected area bordering Cranberry Marsh, before discharging into the marsh and is considered clean runoff. Therefore, no water quality control is required.
- **Catchment 304** – Runoff from this catchment derives from rooftops and lawns before discharging into the Cranberry Marsh and is considered clean runoff. Therefore, no water quality control is required.

#### 4.5 GROUNDWATER

A geotechnical investigation completed by Peto MacCallum Ltd. (dated January 2022) consisting of four exploratory sampled boreholes and three monitoring wells (Boreholes 1, 3 and 4) measured the groundwater one month after installation (December 2021). The geotechnical investigation established that the stabilized groundwater table is within 0.5 m of the groundwater

surface at 179.30 m. The invert of the enhanced grass swale is set to 179.65 m, 0.35 m above the measured groundwater level.

#### **4.6 FLOOD PROOFING**

The Cranberry Marsh high water level has been established as 179.65 m and all proposed units must be adequately flood proofed to a minimum elevation of 180.00 m (0.35 m above the Marsh high water level). This will be achieved by raising the site through the placement of fill.

## 5 Siltation & Erosion Plan

Siltation and erosion controls will be implemented for all construction activities, including topsoil stripping, material stockpiling, road construction and grading operations as per ESC-1 and ESC-2. Detailed erosion and sediment control measures to be implemented during and after construction are summarized as follows:

- heavy duty silt fence will be erected before the commencement of any grading operations to control sediment movement;
- a construction vehicle entrance will be constructed and maintained consisting of a stone mud mat to reduce off-site tracking of material;
- regular inspection of control measures will be instituted, and repairs will be made as necessary;
- temporary swales, sediment trap and rock flow check dams will be constructed to control runoff during construction; and
- long term siltation and erosion control will be enhanced with a revegetation strategy for disturbed areas.

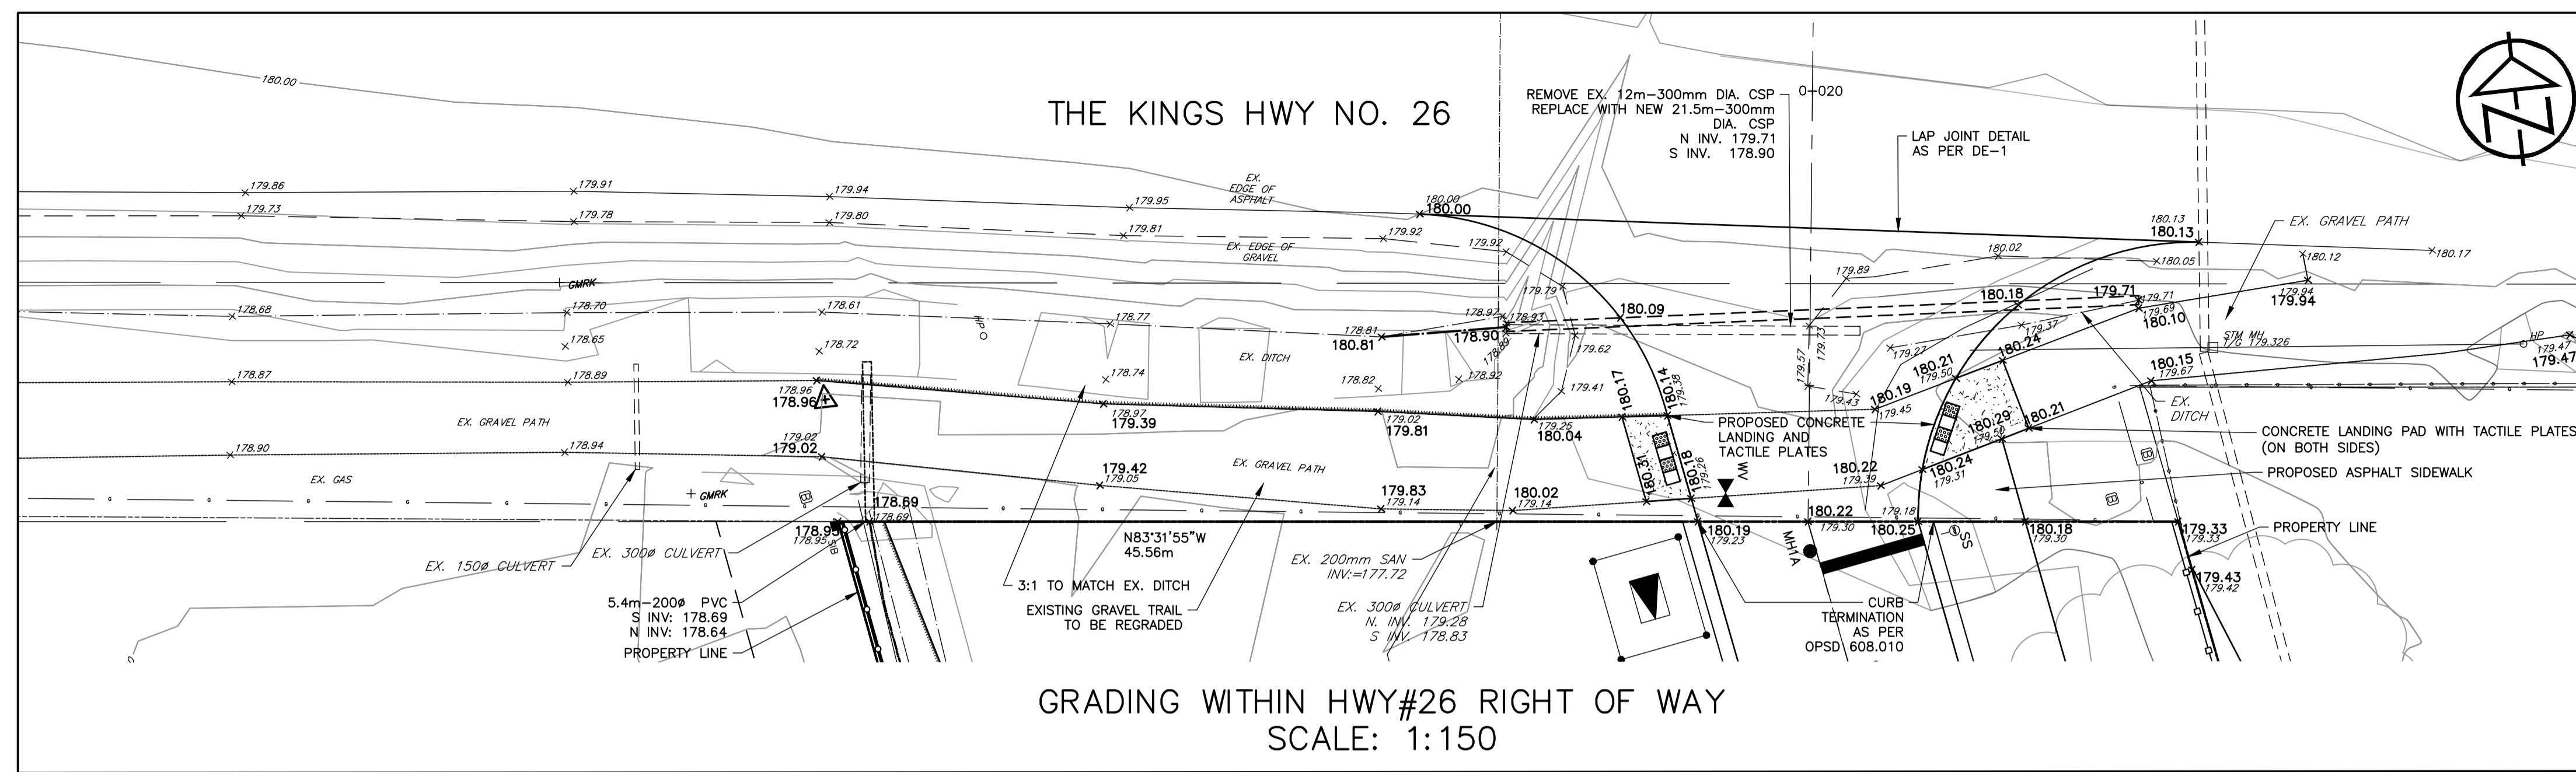

## 6 Summary

The proposed residential development will consist of 26 townhome units in Collingwood connected by a private road and cul-de-sac.

Existing drainage patterns will generally be maintained, with stormwater runoff conveyed via a road network to an enhanced grassed ditch to provide quality control for the site. Surface runoff towards the north will outlet into the Highway 26 roadside ditch, with post-development flow rates matching pre-development flow rates. Surface runoff towards the south will outlet into the Cranberry Marsh with no quantity control.

Siltation and erosion control will be provided with the proper construction mitigation efforts. Long-term erosion control will be enhanced with an effective revegetation strategy.

$V = Lhw_1 + 3h^2L = 99.3 \text{ m}^3 > V_{25\text{mm}} = 98.3 \text{ m}^3$  (Acceptable)

## ENHANCED DITCH OUTLET WEIR CALCULATIONS

### Trapezoidal Broad Crested Weir

Source: Hydraulic Structures, C.D.Smith, University of Saskatchewan

### Trapezoidal Weir

The trapezoidal weir is a combination of the rectangular weir and the triangular weir

### Target Storm

100 -Year Storm Peak Flow For Catchments 203, 204, 205 and 206 (m<sup>3</sup>/s) = 0.257

|   |                            |       |
|---|----------------------------|-------|
| W | Weir Bottom Width (m)      | 2.9   |
| H | Head (m)                   | 0.160 |
| L | Weir Downstream Length (m) | 10    |
| S | Side Slope (horizontal):1  | 3     |

### RECTANGULAR WEIR

$$Q = CWH^{3/2}$$

H/L 0.016  
 C 1.4

Result

**Q Rectangular Weir Flow (m<sup>3</sup>/s) 0.261**

### TRIANGULAR WEIR

$$Q = CH^{5/2} \tan(\theta/2)$$

Notch Angle (one side) 71.6 degrees  
 Notch Angle (one side) 1.25 radians

$$\tan(\theta / 2) = 3.00$$

Triangular H/L 0.016  
 C 1.05

Result

**Q Triangular Weir Flow (m<sup>3</sup>/s) 0.0323**

Total Rectangular + Triangular Weir

$$\mathbf{Q \text{ Total Flow (m}^3\text{/s) } 0.261 + 0.032 = 0.293 > 0.257}$$
